- általában 1-2 szónyi környezet
- nem veszik figyelembe a hasonlóságot

"The cat is walking in the bedroom" "A dog was running in a room"

Elosztott reprezentáció

Figure 1: Neural architecture: $f(i, w_{t-1}, \dots, w_{t-n+1}) = g(i, C(w_{t-1}), \dots, C(w_{t-n+1}))$ where g is the neural network and C(i) is the *i*-th word feature vector.

Maximalizálni

$$L = \frac{1}{T} \sum_{t} \log f(w_t, w_{t-1}, \dots, w_{t-n+1}; \theta) + R(\theta)$$

Input

$$x = (C(w_{t-1}), C(w_{t-2}), \dots, C(w_{t-n+1}))$$

• dim(C) =
$$|V| \times m$$

Output

$$y = b + Wx + U \tanh(d + Hx)$$

► dim(b) = |V|, dim(W) = $|V| \times (n-1)m$, dim(U) = $|V| \times h$, dim(d) = h, dim(H) = $h \times (n-1)m$

Normalizálás (softmax)

$$f(w_t, w_{t-1}, \ldots, w_{t-n+1}) = \frac{e_{w_t}^y}{\sum_i e_i^y}$$

Paraméterek száma

$$|V|(1 + nm + h) + h(1 + (n - 1)m)$$

 Table 1: Examples of five types of semantic and nine types of syntactic questions in the Semantic-Syntactic Word Relationship test set.

Type of relationship	Word	Pair 1	Wor	d Pair 2
Common capital city	Athens	Greece	Oslo	Norway
All capital cities	Astana	Kazakhstan	Harare	Zimbabwe
Currency	Angola	kwanza	Iran	rial
City-in-state	Chicago	Illinois	Stockton	California
Man-Woman	brother	sister	grandson	granddaughter
Adjective to adverb	apparent	apparently	rapid	rapidly
Opposite	possibly	impossibly	ethical	unethical
Comparative	great	greater	tough	tougher
Superlative	easy	easiest	lucky	luckiest
Present Participle	think	thinking	read	reading
Nationality adjective	Switzerland	Swiss	Cambodia	Cambodian
Past tense	walking	walked	swimming	swam
Plural nouns	mouse	mice	dollar	dollars
Plural verbs	work	works	speak	speaks

 Table 2: Accuracy on subset of the Semantic-Syntactic Word Relationship test set, using word vectors from the CBOW architecture with limited vocabulary. Only questions containing words from the most frequent 30k words are used.

Dimensionality / Training words	24M	49M	98M	196M	391M	783M
50	13.4	15.7	18.6	19.1	22.5	23.2
100	19.4	23.1	27.8	28.7	33.4	32.2
300	23.2	29.2	35.3	38.6	43.7	45.9
600	24.0	30.1	36.5	40.8	46.6	50.4

Table 3: Comparison of architectures using models trained on the same data, with 640-dimensional word vectors. The accuracies are reported on our Semantic-Syntactic Word Relationship test set, and on the syntactic relationship test set of [20]

Model	Semantic-Syntactic Wo	MSR Word Relatedness	
Architecture	Semantic Accuracy [%] Syntactic Accuracy [%]		Test Set [20]
RNNLM	9	36	35

1 epoch Skip-gram	600	783M	56.7	54.5	55.5	2.5

 Table 5: Comparison of models trained for three epochs on the same data and models trained for one epoch. Accuracy is reported on the full Semantic-Syntactic data set.

 Table 8: Examples of the word pair relationships, using the best word vectors from Table 4 (Skipgram model trained on 783M words with 300 dimensionality).

Relationship	Example 1	Example 2	Example 3	
France - Paris	Italy: Rome	Japan: Tokyo	Florida: Tallahassee	
big - bigger	small: larger	cold: colder	quick: quicker	
Miami - Florida	Baltimore: Maryland	Dallas: Texas	Kona: Hawaii	
Einstein - scientist	Messi: midfielder	Mozart: violinist	Picasso: painter	
Sarkozy - France	Berlusconi: Italy	Merkel: Germany	Koizumi: Japan	
copper - Cu	zinc: Zn	gold: Au	uranium: plutonium	
Berlusconi - Silvio	Sarkozy: Nicolas	Putin: Medvedev	Obama: Barack	
Microsoft - Windows	Google: Android	IBM: Linux	Apple: iPhone	
Microsoft - Ballmer	Google: Yahoo	IBM: McNealy	Apple: Jobs	
Japan - sushi	Germany: bratwurst	France: tapas	USA: pizza	

Bengio et al 2013: A Neural Probabilistic Language Model

Mikolov et al 2014: Efficient Estimation of Word Representation in Vector Space

Pennington et al 2014: GloVe: Global Vectors for Word Representation

・ロト ・西ト ・ヨト ・ヨー うらぐ

- ▶ a szóanalógiás feladat: King Queen = Man Woman
- vektorok esetén szépen elegánsan vektoriális kivonás
- erre a feladatra fókuszálva dolgozzák ki a glove modellt

megfigyelés 1: i, j, k szavak, P() valószínűségek: $\frac{P(k|i)}{P(k|j)} \gg 1$, ha k jelentése kapcsolatos az i, j szavakkal, de az i szóra jellemző, j-re nem; és közel van 1-hez, ha inadekvát. Tehát a $w_i - w_j$ szóvektorok különbsége a valószínűségük hányadosaival lehet arányos a modellben.

Probability and Ratio	k = solid	k = gas	k = water	k = fashion
P(k ice)	1.9×10^{-4}	$6.6 imes 10^{-5}$	3.0×10^{-3}	1.7×10^{-5}
P(k steam)	2.2×10^{-5}	7.8×10^{-4}	2.2×10^{-3}	1.8×10^{-5}
P(k ice)/P(k steam)	8.9	8.5×10^{-2}	1.36	0.96

megfigyelés 2: $w_i - w_j$ különbség és a w_k próbaszó (probe word) vektorokra szimmetrikus is lehetne a modell (mert a szó-kontextusszó viszony szimmetrikus)

megfigyelés 3: a valószínűségek skalárok, a szóvektorok vektorok, de a két vektor skaláris szorzatát kipróbálhatnánk

levezethető, hogy ilyen tulajdonságokkal rendelkezik ez az egyszerű modell:

$$w_i \cdot w_k + b = \log(X_{ik})$$

a modell betanításához (a *w_i* vektorok kiszámításához) a legkisebb négyzetek megfelelő (a glove-ban még egy súlyfüggvénnyel szorzunk, ami kiegyenlíti a szógyakoriságbeli nagyságrendi különbségeket)

a modell szerencsére a $|V|^2$ -nél sokkal jobban méretezhető, mert az együttes előfordulások eloszlása nem egyenletes, hanem hatványtörvény szerinti (ritka mátrix; polinomiálisan kevesebb számítás szükséges)

Eredmények

világverő :)
